**Background summary:** The Fish and Wildlife Commission (Commission) received a petition to Open fishing for bottomfish in the Northern Hood Canal region and Dabob Bay.

At the October 17, 2014 Fish and Wildlife Commission conference call the Commission directed staff to initiate rulemaking to consider allowing bottomfish fishing for selected species in waters shallower than 120 feet in Quilcene Bay and Dabob Bay north of a true ease line from Point Whitney to the Toandos Peninsula (Figure 1).

The entrance to Hood Canal is shallow (150') and then the canal deepens to about 600'. This sill at the entrance restricts the flow of water in and out of the canal. Freshwater inflow from rivers coupled with poor water exchange can result in a highly stratified water column. These conditions together with the addition of nutrients into the canal from upland sources results in persistent low dissolved oxygen conditions in a substantial portion of the Canal.

In 2002, 2003 and 2004 low dissolved oxygen caused large fish and shellfish kills in Hood Canal. The Fish and Wildlife Commission adopted permanent fishing regulations in August 2004 to close commercial and recreational fisheries to eliminate harvest mortality and provide additional protection from mortality and stress created by low dissolved oxygen conditions. Since the fishing closure has been in place additional low dissolved oxygen events have occurred in 2006 and 2010 resulting in large fish and shellfish kills.

Scientific trawl data show that fish densities in the northern and southern portions of Hood Canal exhibit similar low densities indicating that northern Hood Canal may be providing a refuge for bottomfish that may move to the north as a temporary response to an acute stressor. The northern canal may also provide a source of bottomfish to repopulate southern Hood Canal after low dissolved oxygen events. The trawl data also show that fish densities in the canal are chronically low (compared to densities in the 1960s) and are comparable to current densities elsewhere in Puget Sound, with the possible exception of flatfish species. Having been closed to bottomfish harvest for a decade, the expectation is that Hood Canal populations of bottomfish species should exhibit increased densities as a result of decreased harvest mortality.

Given the status of the bottomfish resources in Hood Canal, Department staff believe there is an opportunity to provide recreational fisheries for flounder, sole and other flatfish – except halibut in Quilcene Bay and the northern portion of Dabob Bay while continuing to provide conservation measures to address low dissolved oxygen conditions in Hood Canal.

Department staff will brief the Fish and Wildlife Commission on public comments received via the online web site.
